How to Specify 90 degree Corners and Patterns

Defining R - Rectangular shape

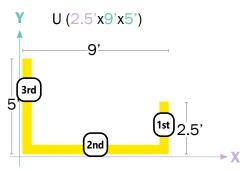

Defining L shape

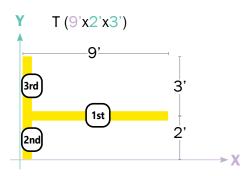

Note: The first number will always define the width, the second - the length.

Defining U shape

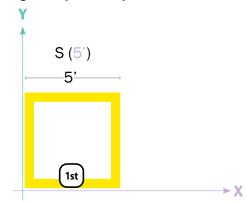

Note: The first number will always define the right arm length, the second - the width, and the third - the left arm length.

Defining T shape

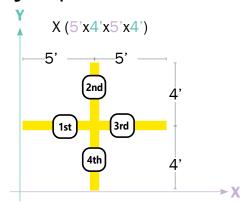

Note: The first number will always define the width, the second - the bottom arm length, and the third - the top arm length.

Defining S - Square shape

Note: The number will define the width. (All sides are the same length).

Defining X shape

Note: The first number will define length of the left arm, the second - the arm length to the right from the first, and so on untill the 4th arm.

WALL MOUNT - INDIRECT REGULAR LIT CORNER PATTERNS

LIT CORNER FEATURES

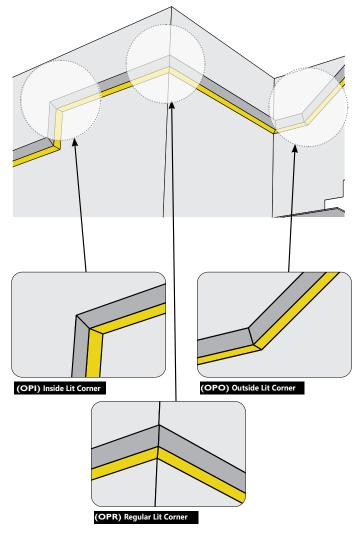

The Lit Corner system allows continuous illumination all the way through the corner section

To optimize corner illumination, lit corners are created as integral components of the linear sections. Linear sections have mitered ends that connect to corresponding mitered ends of neighboring linear sections.

Illuminated Corners are more complex. Because the corner is fully illuminated, the corner is not independent of the straight sections, but integrated into the straight segment's housing. The corner is mitered, allowing a seamless line of light.

Regular Illuminated Corner - A fully illuminated corner that lies on the same plane. There are two corner options available for Regular Lit Corners: Open Shape Corner and Closed Shape Corner

TIP: Provide sketches illustrating corner types and locations required.

Dimming from 80% to 1% will then reduce light
